Copied

Santa Rosa Island California July 1 to 3 1892

W. K. P. Streater

Sitomys ————— Appear to be common distributed about the island.

Urocyon littoralis ————— Very common  
The little Foxes are doubtless much more common on Santa Rosa than any other of the Santa Barbara Islands.

Spilogale ————— All of the old employees of the Island ~~informed~~ me as well as Mr John Croone Manager of the Island ~~informed me~~ that they had seen small Skunks at various times on the island but not common.

Bats are said to be ~~found~~ but not common I saw none during my stay.

<sup>omit</sup> I learned nothing of importance regarding the seals about the island and I believe there are only a ~~limited number~~ <sup>few</sup>.
